

Summation: Searching Virtual Fields

Virtual columns are system fields included in the database that do not have a physical column to display in the user interface. Searching using virtual columns will result in records being displayed in the item list that meet the search criteria, but the column will not appear to display the data. These fields can be selected in the Advanced Search builder when building a Conditions search and can be used in the quick search box.

Following are the virtual fields and their associated search operators:

Virtual Field	Search Operators	Description
AnyDate	Equal	Searches any date field identified in the columns in case review.
AnyField	Equal, Contains	Searches any meta data fields regardless of field type, i.e., text, date, number.
AnyText	Equal, Contains	Searches any text fields and FullText/OCR
Fulltext	Fails, Exists	Searches filtered or OCR text. If a document has both, the OCR is searched.
Image	Fails, Exists	Identifies records that have an associated image.
IsPivot	Fails, Exists	Identifies documents that are or are not a pivot document
OCRText	Fails, Exists	Searches for documents that contain OCR Text, text loaded through the Import Process.
Redaction	Fails, Exists	Identifies documents that have been redacted or have not been redacted.
